#### ALIGNMENTS

double-stranded DNA, or its complementary strand or the corresp.

double-stranded DNA, which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-turranslated sequence; sunique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 272 BP; 48; 78; 86 G; 51 T; Gene signaturė; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-blased library; diagnosis; detection; cell typing; abnormal cell function; ss. Matsubara K, Okubo K;

It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59. 15 G; 4 T;

Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be maplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which cocurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  86 ymrttthhyrrmrbnvyrdyn-rsdaaawyccyrrsvkydccynachhddhyvybbbvyn 144

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Introducing random point mutations into nucleic acods -
Introducing random point mutations into more a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               77-APR-1995 (first entry)
Generic DNA sequence to generate a random TSAR peptide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19 CIGGIACGCCGGCCTGCAGAAGCCCTCGTGGCACCCGCCCCACTGGGTGCTGGGCCCTGT 78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3 ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suiteble host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

CC (700469 is a generic DNA sequence used to generate random TSAR peptide
This generic formula can be represented as follows: X(TGC)(NNB)10-
CC (TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This
CC sequence generates peptides that are cloverleaf in structure. Other
CG generic sequences are shown in 070465-68. Other specific peptides
CG generic sequences are shown in 070465-68. Other specific peptides
CG generated by these generic sequences are shown in R65150-54. TSARS are
CG concatenated heterofunctional proteins or peptides, comprising at least
CG a second effector peptide portion that is chemically or biologically
CA active. They may further comprise a linker peptide between the 2 domains.
CG ontains 2 or 4 cysteine residues positioned in, or flanking, the
CG contains 2 or 4 cysteine residues positioned in, or flanking, the
CG contains 2 or 4 cysteine residues positioned in, or flanking, the

affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radiosotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tersule, Noove, to peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comparising a binding domain and an effector domain comparising a bisclosure; Page 36; 255pp; English.

20 70472 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1(CAC)(NNB)1(CAC)(NNB)(CAC)(NNB)2(AND)6 (CAC)(NNB)4.X and Y are flanking restriction sites of x is not the same as Y) that are not specified further. The peptides generated by this and other generic sequences: (970470.73) have invariant histidine residues incorporated into variant sequences. TSARs at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically cative molety, eg. metal two to deliver a chemically or biologically active molety, eg. metal con, radiolsotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
R65151-54. TSARs are concatenated heterofunctional proteins or peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      070472;
10-APR-1995 (first entry)
Generic DNA sequence to generate a random TSAR peptide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;

Comprising a binding domain and an effector domain

CC R65181-54. TSARS are concatenated by these generic sequences are shown in CC R65181-54. TSARS are concatenated by these generic sequences are shown in CC R65181-54. TSARS are concatenated beterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptides are also designed so confers some degree of conformational rigidity to the peptides. The other concatenated contains 2 or 4 cysteine residues positioned in, or I lanking, the unpredicted or variant residues. These residues confers concerned sequences or conformational rigidity to the peptides. The TSARS confers some degree of conformational rigidity to the peptides. The TSARS confers some degree of conformational rigidity to the peptides. The CC rempress peptide, toxin or enzyme, to the specific target or on the concount or polyclonal antibodies and therefore circumvent the need conformational artipodes and therefore circumvent the need conformation The TSARS are easily characterised and have designed cativity allowing direct and rapid detection in a screening process.

Sequence 114 BB; CASARS are easily characterised and have designed cativity allowing direct and arginal and a replace of the detection in a screening process.
                                                                                                                                                                                    ö
monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 6 A; 12 C; 0 G; 0 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                070465 standard; DNA; 114 BP.
070465;
05-APR-1995 (first entry)
Generic DNA sequence to generate a random TSAR petide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.

Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins

PT screening a recombinant vector library expressing fusion proteins

PT comprising a binding domain and an effector domain

Disclosure; Page 35; 255pp; English.

C70467 is a generic DNA sequence used to generate random TSAR (Totally

C8 Synthetic Affility Reagents) peptides. This generic formula can also be

represented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)17. X

and Y are flanking restriction sites (X is not the same as Y) that are

C8 on the specified further. Other generic sequences are shown in R65151-34. TGARS are concatenated by these generic sequences are shown in

C85151-34. TGARS are concatenated beterofunctional proteins or peptides,

C97 comprising at least two functional regions - a binding domain with

Affinity for a ligand and a second effector peptide portion that is

C98 comprising at least two functional regions - a binding domain with

Affinity for a ligand and a second effector peptide portion that is

C98 comprising at least two functional regions - a binding domain with

Affinity for a ligand and a second effector peptide portion that is

C99 comprising a TGAR binding domain can be used in vivo to

C90 comprising a TGAR binding domain can be used in vivo to

PT Forbials Robinson Street, which bind a ligand - by screening a recombinant vector library expressing fusion proteins accombinant vector library expressing fusion proteins by screening a recombinant vector library expressing fusion proteins by screening a binding domain and an effector domain bisclosure; Page 35; 255pp; English sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be compared as follows: X(NNB)1(TGC)(NNB)7(TGC)(NNB)10x. X and X are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in O70466-68. Comparising at least two functional regions - a binding domain with comparising at least two functional regions - a binding domain with a comparising at least two functional regions - a binding domain with chemically or biologically active. They may further compities a linker peptide between the 2 domains. The oilgonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rigidity to the peptides. The TSARs or compers. Comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active modety, eq. metal ion, radiosotope, peptide, toxin or enzyme, to the specific target or on the contional or polyclonal antibodies and therefore circumvent the need monoclonal or polyclonal antibodies and accomplex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                           Generic DNA sequence to generate a random TSAR petide library. Territy Montains or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins by screening a recombinant vector library expressing fusion proteins by screening a recombinant vector library expressing fusion proteins by screening a recombination of bisclosure; Page 35; 255pp; English.

COMPACT is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)16(TGC)(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(NNB)12(N
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Generic DNA sequence to generate a random TSAR peptide library. TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concateneated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       130 TITCCAGACCAGGIAGGAGCCGTACCCCATGGCTGAGTAGAGCGTGCCCCAGACAGGGCC 71

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOGTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/471,052A
FILING DATE: 06-JUNE-1995
CLASSIFICATION: 530
ATTORNEY/AGBNT INFORMATION:
NAME: Misrock, S. Leslie
REGISTRATION WUMBER: 18,372
FEGISTRATION NUMBER: 18,372
NAME: Misrock, S. Leslie
REGISTRATION NUMBER: 18,872
REFERENCE/DOCKET NUMBER: 1101-179
TELECOMMUNICATION INFORMATION:
TELEFAX: 212 869 8864/9741
TELEFAX: 212 869 8864/9741
TELEX: 66141 PENNIE
INFORMATION FOR SEQ ID NO: 143:
SEQUENCE CHARACTERISTICS:
LENGTH: 68 bases
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: unknown
MOLECULE TYPE: DNA
SEQUENCE 68 BP; 3 A; 3 C; 5 G; 3 T; 54 OTHER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TOPOLOGY: unknown

/Note="Organ: mixed (see below); Vector: pT7T3D-Pac
(PhArmacia) with a modified polylinker; Site_1: Not I;
Site_2: ECO RI; Equal amounts of plasmid DNA from three
normalized libraries (melanocyte 2NbIM, pregnant uterus
NDHED, and fetal heart NDHH19W) were mixed, and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from pools
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 260232-265223,

W12099-W12144 represent alpha-amylase variants of the invention. The W12099-W12144 represent alpha-amylase variants of the invention. The W12099-W12144 represent alpha-amylase sencoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12137-W12140, and W12955, W12956, R81835 and R81836. W12137-W12140, and W12955, W12956, R81835 and R81836. W12137-W12140, and W12956, W12956, R81835 and R81836. W12137-W12140, and W12956, W12956, R81835 and R81836. W12137-W12140, and W12956, W12956, R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability and/or reduced calcium ion dependency. The variants can also have increased alpha-amylases also be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and controlled the washing compositions, and for textile desizing.
activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of sweeteners and ethanol from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-APR-1997 (first entry)
Alpha-amylase variant delta182 + delta184.

W12098-W12144 represent alpha-amylase variants of the invention. The w12098-W12144 represent alpha-amylase variants of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases compared by W12955, W12956, R81835 and R81836. W12137-W12140, and W1243 are specifically variants of the alkaphilic Bacillus strain NCIB (12513 alpha-amylase shown in R81836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees (clicius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylases also binding of a particular substrate. These variant alpha-amylases also coposess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and channol from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-AFR-1997 (first entry)

W12099-W12144 represent alpha-amylase variants of the invention. The W12099-W12144 represent alpha-amylase variants of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12137-W12140, and W1243 are specifically variants of the alkaphilic Bacilius strain NCIB 12513 alpha-amylase shown in R81836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees celcius), and/or vaidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values) in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of sweeteners and ethanol from starch.
mutagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W1217-W12140, and W12143 are specifically variants of the alkaphilic Bacilius strain NCIB 12513 alpha-amylase shown in R81836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylaylytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alpha-amylase; detergent; thermal stability; oxidation stability; enzyme; calcium ion dependency; alpha-amylolytic activity; washing composition; textile desizing; papermaking; beer-making; ethanol production;
                                                                                                                                                                                                                                                                                                                              These variants can also be used in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ë,

mitagenesis of the invention were created uning site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12137 w12140, and W12143 are specifically variants of the alkaphilic Bacillus strain NCIB (W12143 are specifically variants of the see variants can have improved thermal stability (such as at temperatures in the range of 40.70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also cossess improved specificity to a particular substrate, and/or improved cossess improved specificity to a particular substrate, and/or improved specificity and washing compositions, and for textile desizing. The used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in the production composition and washing processes. These variants can also be used in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alpha-amylase; detergent; thermal stability; oxidation stability; enzyme; calcium ion dependency; alpha-amylolytic activity; washing composition; textile desizing; papermaking; beer-making; ethanol production;
                                                                                                                                                                                                                                       08-APR-1997 (first entry)
Alpha-amylase variant delta183 + delta184 + M202L/I.
Alpha-amylase, detergent; thermal stability; oxidation stability; enzyme calcium ion dependency; alpha-amylolytic activity; washing composition; textile desizing; papermaking; beer-making; ethanol production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 2: ; 111pp; English.
W12098-W12144 represent alpha-amylase variants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ë
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alpha-amylase variants - with improved thermal and oxidation stability and reduced calcium ion dependency

Willy Specified and evaluate - with improved thermal and oxidation stability and reduced calcium ion dependency
Stability and y. illippic Emplish.

Wil2098-Wil2144 represent alpha-amylase successor and stability and reduced, or random, and and reduced by Mil2056, Rel 18185 and Rel 1836. Mil2098-Wil2136, Wil2141, Wil2142 and Wil2142 and Wil2152, Wil2156, Rel 18185 and Rel 1836. Mil2098-Wil2136, Wil2142 and Wil2142 and Wil2142 and Wil2142 and Wil2142 and Wil2142 and Wil2152, Wil2156, Rel 1835 and Rel 1836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8:5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved consisting and reference and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and constraint also be used in the production of sweeteners and ethanol from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PER 1996; DK0056.

PT Alpha-amylase variants - with improved thermal and oxidation atebility and reduced calcium ion dependency

PT Alpha-amylase variants - with improved thermal and oxidation atebility and reduced calcium ion dependency

CC Variants of the Invention were created using site directed, or random, witagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12098-W12136, W12098-W12098-W12136, W12098-W12136, W12098-W12136, W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098-W12098
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           08-APR'1997 (first entry)
Alpha-amylase variant delta183 + delta184.

M1209-W12144 represent alpha-amylase variants of the invention. The w1209-W12144 represent alpha-amylase variants of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12098-W12136, W12141, W12142 and W12144 are specifically variants of the alkaphilic Bacillus train NCIB 12512 alpha-amylase shown in R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or reduced calcium ion dependency. The variants can also have increased alpha-amylases also crivity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate. These variant alpha-amylases can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of a particular substrate and washing can also be used in papermaking and beer-making processes. These variants can also be used in the production of a particular substrate and washing can also be used in the production of a particular substrate. These variants can also be used in the production are considered to the starch.
The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of sweeteners and ethanol from starch. Sequence 483 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; ; 11pp; English.

W12098-W12144 represent alpha-amylase variants of the invention. The W12098-W12144 represent alpha-amylase variants of the invention were created using site directed, or random, mutagenesis of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases or represented by W12955, W12956, R81835 and R81836. W12098-W12136, W12141, W12144 and W12144 are specifically variants of the alkaphilius strain NCIB 12512 alpha-amylase shown in R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or caidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also be ossess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be alpha-amylase variants can also be used in papermaking and beer making processes. These variants can also be used in the production of the alpha-amylase variants can also be used in the production of the alpha-amylase variants can also be used in the production of the alpha-amylase variants can also be used in the production of the content of the co
08-APR-1997 (first entry)
Alpha-amylase variant Ri24P + delta183 + delta184.
Alpha-amylase, detergent; thermal stability; oxidation stability; enzyme; calcium ion dependency; alpha-amylolytic activity; washing composition; textile desizing; papermaking; beer-making; ethanol production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detergent compositions for hard surface cleaning and laundry use contains Bacillus derived alpha amylase with improved thermostablilty, reduced calcium ion dependency etc.
Claim 1; Pages 88-89; 97pp; English.
The present sequence is a Bacillus sp. alpha amylase with a specific activity at least 25% higher than that of Termamyl (RTM) at 25 to 55 degrees C at pH 8 to 10, measured by the Phadebas (RTM)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alpha-amylase variants - with improved thermal and oxidation stability and reduced calcium ion dependency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Match 8.5%; Score 100; DB 20; Length 483; Local Similarity 40.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                  Tablility and reduced calcium ion dependency
Claim 11: 111pp: English.
W12098-W12144 represent alpha-amylase variants of the invention. The
W12098-W12144 represent alpha-amylase variants of the invention were created using site directed, or random,
mutagenesis of the invention were created using site directed, or random,
crepresented by W12955, W12956, R81835 and R81836. W12099-W12136, W12141,
W12142 and W12144 are specifically variants of the alkaphilic Bacillus
crepresented by W12955, W12956, R81835 and R81835. These variants can have
improved thermal stablility (such as at temperatures in the range of 40-70
degrees Celcius), and/or oxidation stablility, and/or reduced calcium ion
dependency. The variants can also have increased alpha-amylolytic
critivity (especially at pH values in the range of 8.5-10.5), and improved
binding of a particular substrate. These variant alpha-amyloses also
bossess improved specificity to a particular substrate, and/or improved
specificity with respect to cleavage of Substrate. These sequences can
be used in detergent and washing compositions, and for textile desizing.
The alpha-amylase variants can also be used in papermaking and
c sweeteners and ethanol from starch.
Sequence 485 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        claim 11; illipp; English.

W12098-W12144 represent alpha-amylase variants of the invention. The variants of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases controlled will be parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12098-W12136, W12141, W12142 and W12144 are specifically variants of the alkaphilius Bacilius strain NCIB 12512 alpha-amylase shown in R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also binding of a particular substrate. These variant alpha-amylases also pecificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           08-APR-1997 (first entry)

The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of sweeteners and ethanol from starch.

This alpha-amylase protein is characterized by having a specific activity at least 25% higher than the specific activity of Termamyl at 25-55 deg C and a pH of 8-10. The enzyme can be used in detergent composition for starch liquefaction, the production of lignocellulosic materials, e.g. pulp, paper and cardboard from waste containing starch, for deinking recycled starch-coated, or starch-containing spinted apper, to modify starch for papermaking, for textile desizing, and beer-making processes. This protein may be produced recombinantly.
                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Skalā, J.; Goffeau, Ā.
Yeast (1994) 10:1489-1496
The sequence of a 22.4 kb DNA fragment from the left arm of yeast chromosome II reveals homologues to bacterial proline synthetase and murine alpha-adaptin, as well as a new permease and a DNA-binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 de Wergifosse, P.; Jacques, B.; Jonniaux, J.L.; Purnelle, B.;

GLUCAN 1,4-ALPHA-MALICHEXAOSIDASE PRECURSOR (EC 3.2.1.98) (G6-AMYLASE)
(MALTOHEXAOSE-PRODUCING AMYLASE) (EXO-MALTOHEXAOHYDROLASE).
BACILLUS SP. (STRAIN 707).
                                                                                                                                                                                                                                                         TSURAMOTO A., KINDRA K., ISHII Y., TAKANO T., YAMANE K.;
BIOCHEM. BIOPHYS. RES. COMMUN. 151:25-31(1988).

-1 CATALYITC ACTIVITY: HYDROLESIS OF 1.4 *ALPHA-D-GLUCOSIDIC LINKAGES
IN AMYLACEOUS POLYSACHARIDES SO AS TO REMOYE SUCCESSIVE
MALTOHEXAGSE RESIDES FROM THE NON-REDUCING CHAIN ENDS.

-1 PATHWAY: DEGRADATION OF STARCH.
-1 SUBCELLULAR LOCATION: EXTRACH.
-1 SIDILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO
KNOWN AS THE ALPHA-AMYLASE FAMILY.

PIR; A27705, A27705.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i-FUNCTION: CHICARDLAST OMEGA-3 FRITY ACID DESATURASE INTRODUCES
THE THIRD DOUBLEBOND IN THE BLOSYNTHESIS OF 16:3 AND 18:3 FATTY
ACIDS, IMPORTANT CONSTITUENTS OF PLANT MEMBRANES. IT IS THOUGHT
TO USE FERREDOYIN AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS
ESTERFIED TO GALGACTOLIFIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL.
-I-PATHWAY: POLYUNSATURATED FATTY ACID BLOSYNTHESIS.
-I-SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (FROBABLE).
-I-DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE
AND/ OR BE INVOLUDED IN METAL ION BINDING.
-I-SIMILARITY: TO OTHER PLANT OMEGA-3 FATTY ACID DESATURASES.
                                                                                                                                                                                        PROKARYOTA; FIRMICUTES; ENDOSPORE-FORMING RODS AND COCCI; BACILLACEAE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-FEB-1996 (REL. 33, CREATED)
